

1. Alert Box

An alert box is often used if you want to make sure information comes through to the user.

When an alert box pops up, the user will have to click "OK" to proceed.

Syntax

```
window.alert("sometext");
```

The window.alert() method can be written without the window prefix.

Example

```
alert("I am an alert box!");
```

2. Confirm Box

A confirm box is often used if you want the user to verify or accept something.

When a confirm box pops up, the user will have to click either "OK" or "Cancel" to proceed.

If the user clicks "OK", the box returns **true**. If the user clicks "Cancel", the box returns **false**.

Syntax

```
window.confirm("sometext");
```

The window.confirm() method can be written without the window prefix.

Example

```
if (confirm("Press a button!")) {  
    txt = "You pressed OK!";  
} else {  
    txt = "You pressed Cancel!";  
}
```

3. Prompt Box

A prompt box is often used if you want the user to input a value before entering a page.

When a prompt box pops up, the user will have to click either "OK" or "Cancel" to proceed after entering an input value.

If the user clicks "OK" the box returns the input value. If the user clicks "Cancel" the box returns null.

Syntax

```
window.prompt("sometext","defaultText");
```

The window.prompt() method can be written without the window prefix.

Example

```
let person = prompt("Please enter your name", "Harry Potter");
let text;
if (person == null || person == "") {
  text = "User cancelled the prompt.";
} else {
  text = "Hello " + person + "! How are you today?";
}
```

4. Line Breaks

To display line breaks inside a popup box, use a back-slash followed by the character n.

Example

```
alert("Hello\nHow are you?");
```

5. Window alert()

Example

Display an alert box:

```
alert("Hello! I am an alert box!!");
```

The alert() method displays an alert box with a message and an OK button.

The alert() method is used when you want information to come through to the user.

CSS Functions

<u>acos()</u>	Returns the inverse cosine of a number between -1 and 1
<u>asin()</u>	Returns the inverse sine of a number between -1 and 1
<u>atan()</u>	Returns the inverse tangent of a number between $-\infty$ and ∞
<u>atan2()</u>	Returns the inverse tangent of two values between -infinity and infinity
<u>attr()</u>	Returns the value of an attribute of the selected element
<u>blur()</u>	Applies a blur effect to an element
<u>brightness()</u>	Adjusts the brightness of an element (brighter or darker)
<u>calc()</u>	Allows you to perform calculations to determine CSS property values
<u>circle()</u>	Defines a circle
<u>clamp()</u>	Sets a value that will adjust responsively between a minimum value and a maximum value depending on the size of the viewport
<u>color()</u>	Allows a color to be specified in a particular, specified color space
<u>color-mix()</u>	Mixes two color values in a given color space, by a given amount
<u>conic-gradient()</u>	Creates a conic gradient
<u>contrast()</u>	Adjusts the contrast of an element
<u>cos()</u>	Returns the cosine of an angle
<u>counter()</u>	Returns the current value of the named counter

<u>counters()</u>	Returns the current values of the named and nested counters
<u>cubic-bezier()</u>	Defines a Cubic Bezier curve
<u>drop-shadow()</u>	Applies a drop shadow effect to an image
<u>ellipse()</u>	Defines an ellipse
<u>exp()</u>	Returns E raised to the power of the specified number x (E^x)
<u>fit-content()</u>	Allows you to size an element based on its content
<u>grayscale()</u>	Converts an image to grayscale
<u>hsl()</u> / <u>hsla()</u>	Defines a color using the Hue-Saturation-Lightness model (HSL); with an optional alpha component
<u>hue-rotate()</u>	Applies a color rotation to an element
<u>hwb()</u>	Defines a color using the Hue-Whiteness-Blackness model (HWB); with an optional alpha component
<u>hypot()</u>	Returns the square root of the sum of squares of its parameters
<u>inset()</u>	Defines a rectangle at the specified inset distances from each side of the reference box
<u>invert()</u>	Inverts the color of an image
<u>lab()</u>	Specifies a color in the CIE L*a*b color space
<u>lch()</u>	Specifies a color in the LCH (Lightness-Chroma-Hue) color space
<u>light-dark()</u>	Enables two color-value settings, and returns the first value if the user has set a light color theme, and the second value if the user has set a dark color theme

<u>linear-gradient()</u>	Creates a linear gradient
<u>log()</u>	Returns the natural logarithm (base E) of a specified number, or the logarithm of the number to the specified base
<u>matrix()</u>	Defines a 2D transformation, using a matrix of six values
<u>matrix3d()</u>	Defines a 3D transformation, using a 4x4 matrix of 16 values
<u>max()</u>	Uses the largest value, from a comma-separated list of values, as the property value
<u>min()</u>	Uses the smallest value, from a comma-separated list of values, as the property value
<u>minmax()</u>	Defines a size range greater than or equal to a <i>min</i> value and less than or equal to a <i>max</i> value (used with CSS grids)
<u>mod()</u>	Returns the remainder left over when a number is divided by another number
<u>oklab()</u>	Specifies a color in the OKLAB color space
<u>oklch()</u>	Specifies a color in the OKLCH color space
<u>opacity()</u>	Applies an opacity effect to an element
<u>perspective()</u>	Defines a perspective view for a 3D transformed element
<u>polygon()</u>	Defines a polygon
<u>pow()</u>	Returns the value of a number (x) raised to the power of another number (y)
<u>radial-gradient()</u>	Creates a radial gradient
<u>ray()</u>	Defines the offset-path line segment that an animated element should follow

<u>rem()</u>	Returns the remainder left over when a number is divided by another number
<u>repeat()</u>	Repeats a set of columns or rows in a grid
<u>repeating-conic-gradient()</u>	Repeats a conic gradient
<u>repeating-linear-gradient()</u>	Repeats a linear gradient
<u>repeating-radial-gradient()</u>	Repeats a radial gradient
<u>rgb()</u> / <u>rgba()</u>	Defines colors using the Red-Green-Blue model (RGB); with an optional alpha component
<u>rotate()</u>	Defines a 2D rotation of an element
<u>rotate3d()</u>	Defines a 3D rotation of an element
<u>rotateX()</u>	Defines a 3D rotation of an element around the x-axis (horizontal)
<u>rotateY()</u>	Defines a 3D rotation of an element around the y-axis (vertical)
<u>rotateZ()</u>	Defines a 3D rotation of an element around the z-axis
<u>round()</u>	Rounds a number according to the specified rounding-strategy
<u>saturate()</u>	Adjusts the saturation (color intensity) of an element
<u>scale()</u>	Defines a 2D scaling of an element
<u>scale3d()</u>	Defines a 3D scaling of an element
<u>scaleX()</u>	Scales an element horizontally (the width)

<u>scaleY()</u>	Scales an element vertically (the height)
<u>sepia()</u>	Converts an image to sepia
<u>sin()</u>	Returns the sine of a number (angle)
<u>skew()</u>	Skews an element along the x- and y-axis
<u>skewX()</u>	Skews an element along the x-axis
<u>skewY()</u>	Skews an element along the y-axis
<u>sqrt()</u>	Returns the square root of a number
<u>steps()</u>	Creates a stepped timing function for animations
<u>tan()</u>	Returns the tangent of a number
<u>translate()</u>	Allows you to re-position an element along the x- and y-axis
<u>translateX()</u>	Allows you to re-position an element along the x-axis
<u>translateY()</u>	Allows you to re-position an element along the y-axis
<u>url()</u>	Allows you to include a file in the stylesheet
<u>var()</u>	Inserts the value of a custom property
